

Sheet moss(hypnum sp.)

I'm not robot!

Sheet moss scientific name.

Hypnum cupressiforme is a type of Sheet Moss that grows in a dense sheet across soil and rock (and terrarium substrates). The creeping stems form the mat structure, which are then covered in overlapping leaves - giving the appearance of a cypress tree (hence one of the nicknames). It's actually found naturally all over the world, so you can be confident it's going to do just fine in a variety of terrarium environments. Plant Type Moss Lighting Bright, indirect light Temperature 60-85°F (15-30°C) Watering Infrequent, even moisture Humidity High humidity (60-90%) Growth 1-5 inches Lighting Ideally, Hypnum cupressiforme would be placed in a low light terrarium environment like the forests it naturally inhabits. Direct sunlight could easily burn the moss. Watering Unlike some other terrarium mosses, Hypnum Moss doesn't need to be saturated with water all the time. In a closed terrarium system, it's unlikely to need any extra misting. In fact, it'll probably rot if overwatered. Substrate Hypnum Moss is found growing on all kinds of natural surfaces in the wild. It should grow readily on any typical terrarium substrate. Make sure the substrate has plenty of drainage to prevent this moss rotting. Temperature & Humidity The fact that Hypnum cupressiforme is so prolific around the world tells us it's able to handle a variety of conditions. It's very common in the tropical vivarium industry, so it does well in a high temperature and humidity environment. Growth As the 'Sheet Moss' term implies, this moss is very capable of growing a healthy, thick carpet. Perfect for lining the bottom of a terrarium (or mossarium), it'll happily grow to cover it. Propagation Hypnum Moss will happily propagate through simple division. Isolate into patches or single stems and they should each start a new moss colony of their own. Varieties & Similar Plants Hypnum Moss has many notable varieties, and they come in a range of colours. Hypnum lacunosum is a thick, golden brown moss with swollen leaves. Common Problems Hypnum Moss needs less water than some other terrarium mosses or plants. Take care not to overwater this moss whilst hydrating your terrarium. Reviews (1) 5 Posted by Joey Anniston on Jan 26, 2022 I can spread a sheet of cloth for a non busy day picnic just in front of my yard. This carpet like moss has been in my yard for so long. We dig fresh our plants and ship immediately. We ship US Mail, Priority shipping. You will receive a tracking number once your plants ship. All plants will be fine in their packages for up to 3 days after receiving. How We Protect Your Plants For Transit We sell only bare root plants. We dip the roots in terra-sorb silicone gel to retain ample moisture for transit and surround with plastic. This is superior protection for plants in transit for up to 12 days. Upon Receipt Of Your Plants Open your plants and inspect the same day received. We offer 3 days to report any problems with your order. Bare root plants need to be planted within 2-3 days of receiving unless weather-related problems prohibit planting. Store in a cool place and keep roots moist and covered with plastic until they can be planted. Water for the first week daily after planting. Hypnum moss is also known as cypress-leaved plant moss. It's common around the world, especially in forests and shaded woodlands. It's one of the other twelve thousand species of spore-bearing land plants. Hypnum Moss is called "Feather Moss" due to its leaf shape. Hypnum Moss is Best found on Dark Forest Floors and Rocks. Hypnum Moss forms carpet-like sheets on dark forest floors and rocks; Its size ranges between small and medium. Its stems are short and medium reddish-brown. The leaves that grow from it are spiraled and skinny. They resemble the leaves of a Cypress tree. The leaves can grow to about two millimeters in length; This moss is colored a gorgeously vibrant green and darker green. The plant's spores grow in pods attached to stalks from the moss. Hypnum Moss is involved as both female and male plants grow from it. Other classifications for Hypnum moss are upright, carpet, cushion, and clumping moss. The plant has a unique growth pattern that is extremely flat. It also hosts a non-vascular system. This moss has a high transplant success rate and can handle a little sunlight, but not directly or very often. Many people choose to plant it because of its soft and cushiony texture. Using low-lying plants as an extra accent is fantastic. It's the most popular choice for many gardeners. This soft and spongy plant looks impressive between stepping stones or on a path. Some people even use it for their entire lawn. Hypnum Moss is the most common moss. About twenty-five percent of the species grow in North America. The other seventy-five percent grows everywhere except for Antarctica; There are even a few aquatic species of Hypnum Moss. It's tolerant of pollution and thrives in acidic environments. It used to be given as a treatment for Insomnia. The Greek word Hypnos is where we get the name Hypnum. Interestingly, Hypnos translates to sleep in English. Ironically, Hypnum Moss was initially used to fill pillows and mattresses. Hypnum Moss is For Sale at TN Wholesale Nursery with Low Prices and Fast Shipping Hypnum Moss (Sheet Moss) CARPET MOSS There are some great choices if you're looking for moss for sale. In addition the Hypnum moss have some interesting qualities. The next time you walk into a garden, take a look around you. Over 14,500 species belong to the Plantae kingdom, like moss. Moss, a plant of the Bryophyta division, is identified through the growth pattern and non-vascular system. Some classifications include carpet, cushion, upright, or clumping moss. The benefits of moss are many; it is highly favored in décor and also acts as a fertilizer to new soil. Hypnum moss is a well-known part of the Hypnaceae family. Over 20 species exist, with just as many names. Sheet Moss Has Lots Of Uses It is recognized as sheet moss, feather moss, carpet moss, fern or log moss, and brocade moss. Many gardeners prefer this plant because of its ability to replace a grass lawn. Phases of radiant green to yellow green color are expected, with low growing, individual branches that are bristly and sometimes curly. One characteristic that differentiates hypnum from the rest is the absence of its midrib, or costa. Its high transplant success rate makes this sheet moss an adaptable species; it can grow amongst rock, logs, and other plants. Hardy Zones For Hypnum Sheet Moss Partial sunlight or shade is preferred. Sandy or acidic soil provides a thriving environment, especially when planted in the spring. Some gardeners rely on hardiness zones, geographically marked areas that defines the success of a plants growth. It has been known to cultivate well in zones 8-11, but due to its versatility, it depends. Hypnum moss has come to be recognized as a botanical preference and be found outdoors or online. Many mosses can grow in a terrarium as well. However, remember that Mother Nature always knows best. Pricing is for 5 Lbs. (covers 5 sq ft) Species of moss Hypnum cupressiforme Scientific classification Kingdom: Plantae Division: Bryophyta Class: Bryopsida Subclass: Bryidae Order: Hypnales Family: Hypnaceae Genus: Hypnum Species: H. cupressiforme Binomial name Hypnum cupressiforme Hedw. [1801] Hypnum cupressiforme, the cypress-leaved plaitmoss[1] or hypnum moss, is a common and widespread species of moss belonging to the genus Hypnum. It is found in all continents except Antarctica and occurs in a wide variety of habitats and climatic zones. It typically grows on tree trunks, logs, walls, rocks and other surfaces. It prefers acidic environments and is fairly tolerant of pollution. It was formerly used as a filling for pillows and mattresses; the association with sleep is the origin of the genus name Hypnum (from Greek Hypnos). Capsules It is a small to medium-sized moss about 2-10 cm long. It is pleurocarpous, having prostrate, creeping stems which form smooth, dense mats. The stems are branched and covered in overlapping leaves giving the impression of a cypress tree. The stem leaves are long and thin measuring 1.0-2.1 mm by 0.3-0.6 mm. They are concave and sickle-shaped, tapering towards the tip. The branch leaves are smaller and narrower than those on the stems. The moss produces short, cylindrical and slightly curved capsules which contain the spores. The capsules are 1.7-2.4 mm long and have a lid-like operculum measuring 0.6-0.9 mm. They are borne on reddish-brown stalks which are 1-2.5 cm long. The moss is dioicous, having separate male and female plants. Hypnum cupressiforme is a highly variable species and numerous varieties have been described. References Wikimedia Commons has media related to Hypnum cupressiforme.
