How to share apk to android tv. How to transfer apk file from mobile to android tv. How to send a file to android tv. How to send apk from iphone to android tv. How to send file from android to android tv. How to send apk file to android tv.

The Android TV platform is one of the most diverse ones out there when it comes to app availability. Like your Android phone, you get access to the Google Play Store on your Android TV to download apps and games of your choice. However, not all Play Store apps are available for Android TV. Take for instance Google Chrome. If you would like to access the web browser on your older Android TV, you won't be able to install it from the Google Play Store like other apps. That's where sideloading comes in handy. Note that the browser is available on new Google TV devices, so you won't need to sideload it there. However, the method described below will work for all other apps you may want to sideload on your Android TV/Google TV devices. What's great about the Android TV platform is that unlike other smart TV operating systems, LG's webOS, for instance, you can install an Android Application Package or APK on it. This guide will talk about two of the simplest ways of sideloading apps on Android TVs – using Android phones and the cloud. Both methods are easy to follow and get the job done, so let's look at how they work. If you have an Android phone, sideloading apps on your Android TV can be a piece of cake. But before you get started, you'll need to download the required APK file on your Android phone. One of the best resources to find APKs for apps you want to install on your Android TV is APKMirror. Open the website on your Android phone and install the APK of your choice. We chose to install Google Chrome on our Android TV for this article. Once you've installed the APK file on your phone, follow the steps below to port it to your Android TV. Adama Sharma / Android Authority Once the app is installed, open it on your TV and select the "Receive" option. Simultaneously, open the app on your phone and select the send option. You will now see a file menu on your phone. The APK you have downloaded should be in a folder named "Download." Select the APK, and you should see the name of your TV on your phone screen. Select it, and initiate the transfer. Once the transfer is complete, you should be able to select and open the file on your TV. When you do that, you'll ideally see a prompt to install the application. However, the open button doesn't always work as intended in the Send Files To TV app. Worry not. You can still install the APK you just transferred to your TV using an app called File Commander. Adama Sharma / Android Authority Download File Commander on your Android TV from the Google Play Store. Open the app and select the "Internal Storage" option. Adama Sharma / Android Authority Here, you'll find your transferred APK in the "Download" folder. Select the file, and you should see a message on your screen saying "Staging app." You might get a prompt saying that installations from unknown sources are not allowed. If this happens, just tap on the "Settings" button that pops up with the message and slide the toggle next to the name of the app you're using to install the APK (File Commander or Send Files To TV). Your APK should now start installing. When you see the app installed message on your screen, just press "Open" and your app should start up. Before you get started, you'll have to download the APK of the app you want to sideload and transfer it to your cloud storage. We used Google Drive for this guide. Many people have a Gmail account with at least 15GB of free storage, so it's easiest to recommend downloading the APK file from APKMirror on your phone or PC and add it to your Google Drive. If you have too many items in your Drive, you might want to pop the APK in a separate folder just so it's easy to find when you access the Drive on your TV. Now follow the steps below to sideload the app on your Android TV. Download and open the File Commander App on your Android TV. Sign-in to the cloud storage account of your choice. We signed into Google Drive. Adama Sharma / Android Authority You should now be able to see your Google Drive files on your Android TV. Select the APK file you want to install and you'll see a message saying "Staging app." Adama Sharma / Android Authority If you haven't already given the necessary permissions to File Commander to install apps, you might get a prompt saying installations from unknown sources are not allowed. In this case, all you need to do is press the "Settings" option that comes with the prompt and toggle the switch on for File Commander to allow it to install the APK. Your app will now continue installing and you can start using it once the download is complete. You can also use the File Commander app to sideload apps using a USB stick or hard drive. Simply add the APK file to your USB drive and attach it to your Android TV if it has a USB port. You can now open File Commander on your TV to access the contents of the USB drive and follow the same steps above to install the APK. How to open sideloaded apps on Android TV? Adama Sharma / Android Authority Once you're done sideloading an app on Android TV, you might not know where to find it when you want to open it. Unlike Android phones, you won't see sideloaded apps in the launcher or the apps menu. However, you can still access them through the setting menu of your Android TV device. To find your sideloaded app, just head to the setting (gear icon) on the home screen of your Android TV. You'll find an "Apps" section here where you'll be able to select and open the app you sideloaded. Android apps Android TV Smart TV download jio tv apk and enjoy the app. This is the latest version apk download now and enjoy jio tv pk for android tv and enjoy the app on your tv. \*\*download\*\* // Download // Click on the "Website" link given below to download the jio tv apk for android tv 1/3 The free RTS TV app for Android gives users access to thousands of live TV channels online. Although it focuses on TV channels from Asian countries, including India, Pakistan, and Bangladesh, you can also watch channels from Canada, the UK and the USA. Channels are available in HD, and you can watch a wide range of genres, including movies, religion, and live sports. Your device will need to be running Android 5.0 or newer, but that's the only restriction. There's no premium option, so you have access to the RTS TV app's complete offering. Other live TV apps worth considering include Livenettv and Watch TV Free. Made for Asia The range of channels offered by the RTS TV app is focused on viewers across Asia. This isn't surprising, given that the app was developed by a blogger identified as RTSaiful, based in Bangladesh. Channel categories As you might expect, the RTS TV app gives users access to thousands of live TV channels online. You can watch comedy, movies, drama, religion, live sports and much more wherever you have an internet connection. In all, there are more than 1,000 channels available to you. Watching in HD Many of the available channels air programs in HD. If your Android device has that capacity and a reliable enough Internet connection, you can enjoy this superior viewing quality. Stream shows There is a plethora of free TV streaming apps available for Android; this is one of our current favorites. Whereas some tend to focus on sports, the RTS TV app offers a full range of channel categories with many channels available in HD. It has more selection among Asian channels, so this free video-streaming Android app is particularly suited for anyone interested in viewing channels from that part of the world. However, it also has channels from the UK, United States and Canada, so this free video-streaming Android application is worth a download. We don't have any change log information yet for version 3.1 of RTS TV APP. Sometimes publishers take a little while to make this information available, so please check back in a few days to see if it has been updated. Can you help? If you have any changelog info you can share with us, we'd love to hear from you! Head over to our Contact page and let us know. Xender is a cross-platform file sharing application, which uses a wireless connection to transfer files, pictures, music and videos at lightning speed. Not so long ago, Bluetooth was all the rage but Xender has taken advantage of the new technology which allows devices to create their own local WiFi network. This means no data charges and it is much faster than Bluetooth. In fact, Xender's file transfers are 200 times quicker. Xender uses the latest and greatest technology. Xender quickly became one of the most popular apps on the market, following their initial release on 1 June 2017. Within a few months they had millions of users. Popularity is not necessarily a sign of quality. Sometimes they are popular simply because they are popular. Xender's success is due to the quality of its technology and ease-of-use. It just does the job better. How does Xender work? The program is enabled by using a local WiFi network. The Xender app can transfer files from mobile to mobile, mobile to PC and PC to mobile. The process varies slightly depending on which operating system you are using. The most straightforward way is transferring from Android to Android and the only cross-platform transfer you may find problematic is with iOS. Apple has notoriously strict rules when it comes to app downloads (for better and worse). As a result, transferring apps to and from iOS devices can be tricky but everything else works the same. Android to android transfers are the easiest to do. First, activate your mobile hotspot and get the other mobiles (up to four devices can be synced at any one time) to connect to your hotspot. Second, open up the Xender app and tap the plus (+) icon and 'Create Group'. From the other Android phones, tap the plus (+) icon and then 'Join Group'. Next, you click on the 'Group' and you will be connected. That's it. You are free to share your files now. The process is similar with all mobile operating systems. Connecting mobile to PC is different but equally as easy and all operating systems follow the same steps. Make sure your mobile and the PC are on the same WiFi network. Tap the plus (+) icon in the Xender app and then choose 'Connect PC'. Your phone's camera will then be opened through which you scan the QR found at the developer's website on your PC. They will then automatically pair. Is my phone or PC compatible with Xender? Xender can be used across a range of platforms and devices. In terms of mobile phones, you can use either Windows, iOS or Android. If you want to use a PC, it works with both Windows and Mac computers. The program is multiplatform too so you can send files from Android mobiles to iPhones, for example. Are there any better alternatives to Xender? There's a lot of competition harnessing this file sharing technology. Shareit, Superbeam and Portal are just a few examples of other extremely popular apps in the space. Although they offer a similar service at heart (transferring files), they differ slightly when it comes to the look, functionality and user experience. Superbeam looks very cool, for example. It has gone to town on the visual experience for users, which reminds you just how clever the technology is. Shareit is arguably at the top of the leaderboard, if you are just counting downloads, and Portal uses WiFi Direct (so you don't need to be on the same local network) which has proven popular. In spite of the many options out there, there are a number of reasons which have set Xender apart from the rest. The program is simple and well-built, it is free, there are no adverts and it works across multiple platforms in up to 30 languages. While many other apps will offer all of them, Xender also has regular bug updates. One bug which needs fixing is that it closes periodically (which is really annoying if you're listening to music through the application) but this will get sorted on the next update no doubt. A simple but powerful file transfer tool! Since this technology space has become available, apps have popped up to take advantage of it. There are no household names yet and there are many file transfer apps to pick from. You can certainly rule out all of those still using Bluetooth or other near field communication technologies. From the outside it can be hard to choose between the apps: they all seem to be doing the same thing! While it is true that there are many apps using local wireless connection to transfer files, if you dig a little deeper it is possible to distinguish between them. Xender may seem simple compared to the other apps. It has just compacted the best of file sharing potential into the greatest range of operating systems with multiple connections available. The program is a mere 4.5 MB after the latest update which makes downloading it a breeze. The program is actually not so simple but they've made it look easy and effortless, without going too overboard on the aesthetics. The result is a nice, clean design which works for everyone. Plus, who really cares about having graphics of radars scanning for devices or satisfying representations of them when they are connected? That is a slim area to focus on at best. People want what Xender has: a simple and easy-to-use interface which is completely intuitive. In short, it does what it says on the tin. What is the final verdict on Xender? If you are looking for a file sharing application then go for Xender. It is really not worth sacrificing any of Xender's functionality for some unnecessary bells and whistles. Equally, some apps have slipped in either a premium service option, advert or some other money-making feature. This may give the illusion that you will be getting more but that rarely the case, at least nothing relevant to the main purpose of the app. For example, lot of apps have made the ability to add more than one connection to a transfer into a premium service. Don't fall for it! It's free on Xender.
